

Available Packages

Several different packages are available for download. The **full package** includes all sources, jars and documentation of the main system and the standalone platform. The **jadeadapter** contains the FIPA-compliant JADE agent platform developed by Telecom Italia, and the necessary adapter classes to run Jadex agents on JADE. The **beanyner** is a small tool to generate JavaBeans from ontologies created in Protégé. Additionally the **user guide**, **tool guide** and a **tutorial**, which are included in the distribution, are also available for separate download.

Download Instructions

The latest beta of Jadex is **version 2.0-beta4**. The beta is stable but uptodate documentation for this version is not yet available. In addition some smaller functional aspects might be added to the planned final 2.0 release. The latest release of Jadex is **version 0.96**. All released files (also from previous versions) can be downloaded from the SourceForge.net [Download Page](#) . Note that all files are released under [LGPL-License](#) . The current version of Jadex requires [Java SDK 1.4](#) or later. Other required 3rd party jars are already included within the distribution.

Latest Beta Files (2009-07-09)
